EuroJOC's comparison feature summarizes the data on a cost item number basis and presents the differences between two selected estimates. The item detail tab is designed as part of comparison to present the underlying detail items making up the summary item displayed on the 'Compare Results' tab.

The detail feature might be used within a negotiation meeting to examine the details of a specific item number. At a glance the user would be able to pick up doubling or missing errors. The user can view the first estimate as the top grid and the second estimate on the bottom. The information could be viewed by the contractor by moving the horizontal bar either up or down to hide the owner's estimate. The user should keep in mind that often two different cost item numbers are used to represent the same item of work.

The grid color displayed is determined by the radio button selections. A contractor's proposal is presented in green while an owner's estimate is presented in blue. You would never show the contractor the blue colored grid.

The detail estimate grids use the preference form settings to determine columns shown. The detail grids are read/only and cannot be used to modify the underlying data sources. The detail grids include the grid split capability in the lower left corner of the grid. Drag the black square to the right to create one or more grid splits. The left and right arrow buttons on the tool bar move within the compare results and change the details displayed.
